World Military Expenditures and Arms Transfers 1967-1976

This publication is based on information available as of December 31, 1977. The data presented in this report are the best estimates present sources permit. It should be noted, however, that national data are not of equal reliability. Some are subject to a considerable margin of error, especially for countries having a restrictive data disclosure policy or a developing national statistical system. The value data were converted to dollars using exchange rates unadjusted for purchasing power parities, and thus precise comparisons between countries are not valid.

Comments and queries regarding this publication are welcomed. They may be directed to Mr. Edward T. Fei, (202) 632-8659.

World Military Expenditures and Arms Transfers 1967-1976

U.S. Arms Control and Disarmament Agency

FOREWORD

In May 1977, President Carter announced a new U.S. policy calling for substantially greater restraint in exporting weapons and weapons-related equipment to nations other than our treaty partners. In this period of widespread economic difficulties, there is growing recognition that more rational use of the world's finite resources is of increasing importance to all countries. The United Nations General Assembly Special Session on Disarmament held in May and June of 1978 stimulated interest in problems of military expenditures, arms transfers, and economic development; new courses may be charted as a result.

The United States Arms Control and Disarmament Agency welcomes the increased public attention to these subjects. In this publication we seek to provide information to facilitate analysis and interpretation of worldwide military expenditures and arms transfers. This 10th report in the series has been expanded in three ways: selected additional economic and social indicators have been included for comparative purposes, more commentary and graphics have been added to highlight significant findings derived from the data, and essays have been introduced to expound on two subjects that should be of interest to the general and professional reader.

The familiar problems of data validity and completeness have not gone away, but rather have been compounded by the addition of new numerical series. Most countries do not disclose complete information about their military programs. Thus various means of estimation must be used. Although data about public expenditures for health and education are more widely available from national sources, there is frequently a substantial time lag in their availability, and they vary considerably among different nations both in coverage and in reliability. Nevertheless, gross comparisons are possible that yield important information about comparative trends. In general we have relied on data from U.S. or foreign national sources or published by international organizations. Resulting differences in definitions or coverage are stated to the extent that they could be identified.

We hope that this publication will help to focus attention on the serious need for timely, reliable data about worldwide national expenditures. But its primary purpose is to stimulate informed attention to the growing global trade in destructive weaponry, to the increasing diversion of scarce resources to military purposes, and to the opportunities for arms control that these circumstances suggest.

WORLD MILITARY EXPENDITURES AND ARMS TRANSFERS 1967-1976

HIGHLIGHTS

The nations of the world spent the equivalent of about \$400 billion for military purposes in 1976. After accounting for price changes due solely to inflation, this amount represented an increase of almost 3 percent from the comparable 1975 total.¹ Moreover, it continued the gradual upward trend in worldwide military expenditures evident since the end of the Second World War.

Data pertaining to military expenditures are presented in tables I and II. Table I shows military expenditures and gross national product on a worldwide and regional basis, in current and constant dollars. Expenditures for central government, public health, and public education are given in constant dollars. The last five columns show the ratio of

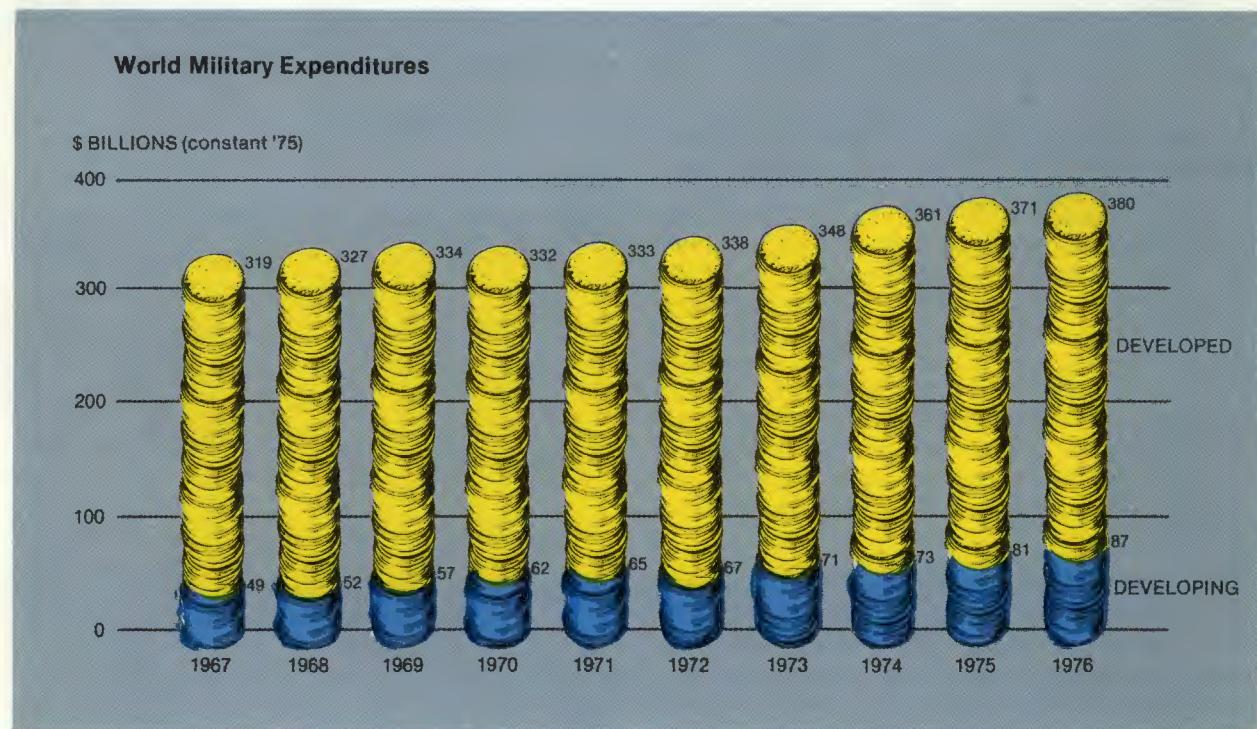

military expenditures to gross national product and to central government expenditures, and the ratio of health and education expenditures to gross national product and to military expenditures. Table II presents the same data for each country individually.

In general, military expenditures increased in almost all regions of the world throughout the 1967-1976 period, even after adjustment for inflation. Overall, in real terms, the nations of the world spent nearly 20 percent more for military purposes in 1976 than they had 10 years earlier. The developed countries continued to account for the largest proportion of the total, but, as shown in figure 1, military expenditures by the developing countries represented an increasing share, growing from 15 to 23 percent between 1967 and 1976.

The decline in the relative amount expended by developed nations came about largely as a result of a decrease in U.S. military expenditures. As illustrated in figure 2, U.S.-paced NATO military expend-

¹ The results of calculations which discount the effects of inflation are said to reflect the "real" change in expenditures. For convenience, this term is used throughout this essay.

Figure 1

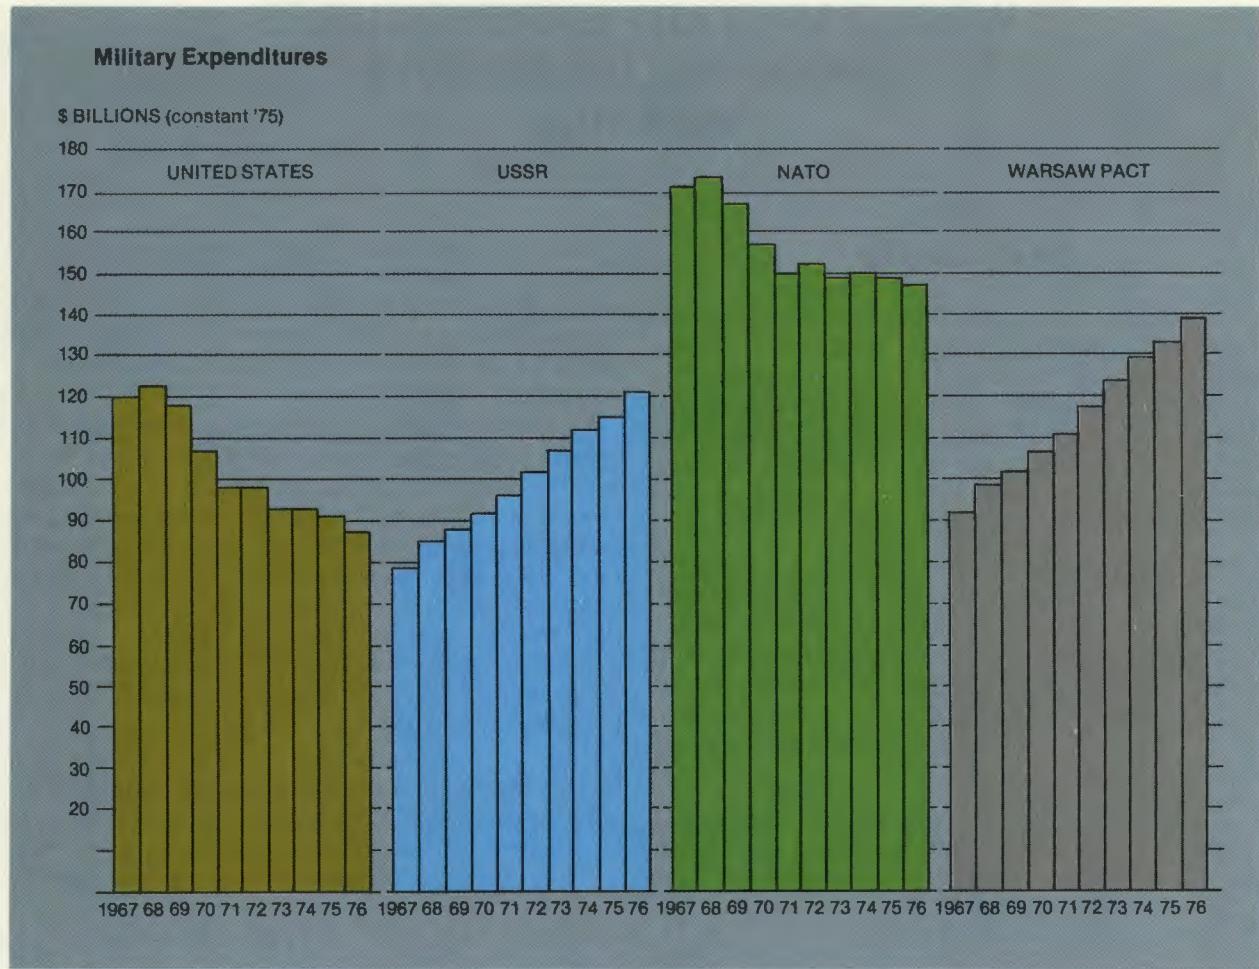

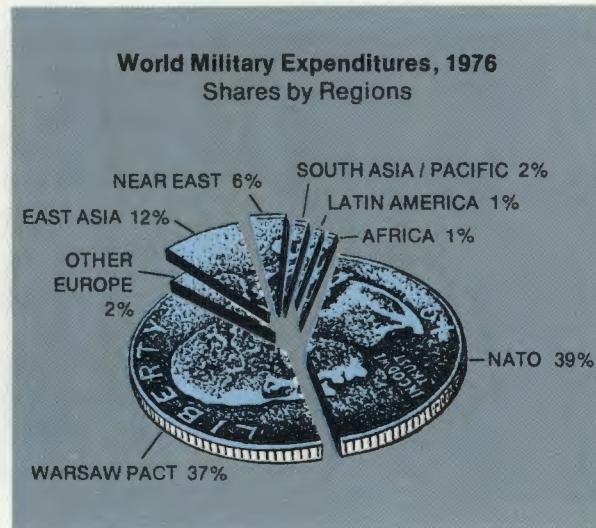

Figure 2

itures decreased from a peak in 1968, while Soviet-paced Warsaw Pact expenditures continued to rise.

Military expenditures by members of NATO and Warsaw Pact nations together accounted for about three-fourths of the world total in 1976 (figure 3). Elsewhere in the world, the nations of the Near East and East Asia continued to spend considerably more for military purposes than other less developed nations, but African and Latin American nations, while starting from much lower bases, also showed substantial increases (figures 4 and 5). The data in figure 6 summarize changes in military expenditures for these various regions of the world between 1967 and 1976.

The relative burden of a country's military spending is commonly measured by the proportion of gross national product (GNP) that it represents. All told, in 1976 world military expenditures accounted for 5.8 percent of the sum of the world's gross national products. This measure is shown for individ-

Chart 1

Within each cell, ranked according to Military Expenditures as percent of GNP

ual countries in chart I, where the nations of the world also are arrayed in terms of per capita GNP. The latter provides further insight into the burden of military expenditures.

The relative burden of military expenditures can become more meaningful when compared to expenditures used for other purposes.² For example, total world military expenditures in 1976 were about two-and-a-half times those for public health. On the other hand, total public education expenditures were 6.5 percent greater than those for military expendi-

tures. The shares of worldwide GNP spent on health, education, and military expenditures in 1976 were 2.4, 5.8, and 5.8 percent, respectively. Since 1967, the portion of the developed world's GNP allocated to public health and education has increased relative to the share allocated to military expenditures (figure 7). At the beginning of the decade, developed countries spent approximately equal amounts on military expenditures and on health and education combined. But by 1976 they only spent about half as much for military purposes as they did for health and education. In sharp contrast, developing states continue to spend only about half as much for health and education as they do on the military.

The region with the sharpest increase in the relative burden of military expenditures was the Near East. Less severe but similar increases took

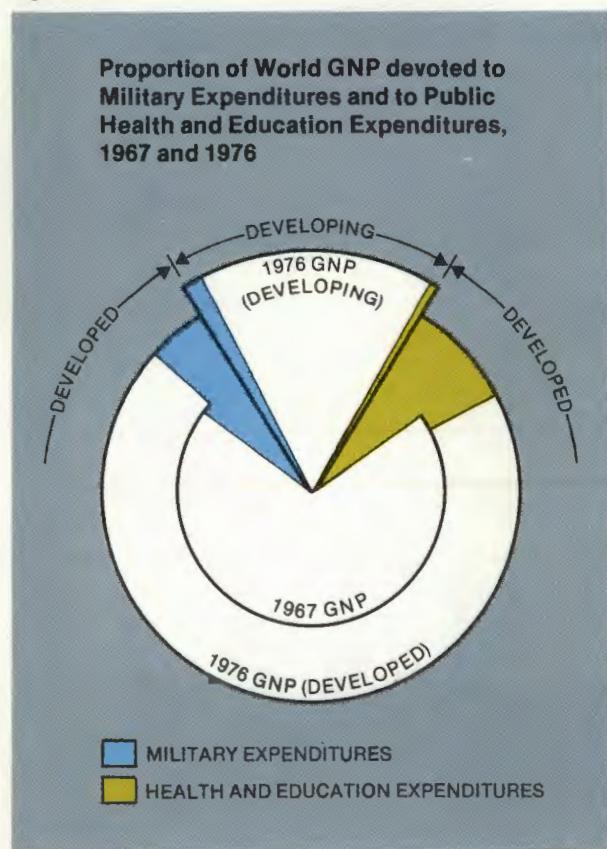

² Information on private health and education expenditures is not available on a worldwide basis. The relative importance of these expenditures varies considerably. In the United States, private school expenditures in 1976 comprised 19 percent of total school expenditures while private health expenditures accounted for 58 percent of total health expenditures.

place in the regions of Africa and South Asia. As a group, states belonging to the Organization of Petroleum Exporting Countries (OPEC) also sharply increased military expenditures during the decade.

The data in figures 8 and 9 describe these leading nations in terms of military expenditures, military expenditures as a proportion of GNP, and health and education expenditures as proportions of GNP.³ The Soviet Union expended the most on its armed forces, almost 40 percent more than the second ranking nation—the United States. Together, these two countries accounted for slightly more than one-half of the world's total. The People's Republic of China, the Federal Republic of Germany, and France ranked third, fourth, and fifth. All told, these five nations expended more than 70 percent of the world's total. Not surprisingly, four of these five nations are among the world's leaders in public health and education expenditures as well.

³ The difficulties in obtaining estimates of health and education data for many countries, and the problem of lack of comparability of definition and measurement of these variables—both across nations and within nations across time—limit the use of these data to only rough comparisons. Thus, the countries have been divided into quintiles, and comparisons made only in these terms. Data for Israel, Saudi Arabia, and Syria are estimates.

Figure 7

An entirely different picture appears when countries are ranked by the proportion of GNP devoted to military expenditures. The first four are all in the Middle East. Although two—Israel and Saudi Arabia—tend also to spend considerably more than most nations on education, available data do not show them to be among the leading spenders for public health. Available data for the Soviet Union, the fifth in this ranking, show it to spend comparatively large amounts for both public education and public health. Soviet private expenditures in these fields are, of course, minor.

Examining military expenditures as a share of total central government expenditures (CGE) is also a useful way to identify spending priorities. It is a necessary complement to military expenditures as a share of GNP, because countries vary widely in the degree to which their resources are expended by a central governmental authority. Worldwide CGE rose from \$965 billion in 1967 to \$1,680 billion in 1976, a real increase of 74 percent. As a share of total available resources, as indexed by GNP, CGE increased from 21.4 percent to 25.5 percent during the 10-year period.

For the world, while the military share of CGE declined, other priorities in governmental expenditures changed very little between 1967 and in 1976. As expressed as a proportion of CGE, health, education, and military expenditures accounted for 9, 23, and 23 percent, respectively, in 1976, and 9, 23, and 33 percent, respectively, 10 years earlier. The developing countries showed similar trends: they allocated 5 percent of CGE to health, 14 percent to education, and 33 percent to military expenditures in 1976; the comparable figures in 1967 were 5, 15, and 41 percent.

In 1976 the highest military expenditure/CGE ratio was recorded for the Soviet Union (.53), followed closely by Oman (.47), Israel (.41), and Yemen (Aden) (.39). The lowest milex/CGE ratio was observed for the six countries which showed no military expenditures whatsoever: Botswana, Costa Rica, The Gambia, Iceland, Lesotho, and Surinam.

Tables III and IV show total populations, armed forces, teachers, and physicians both in total numbers and per thousand of population. Teachers and doctors are also shown as a percentage of armed forces. The last two columns are per capita gross national product and military expenditures. Table III aggregates these data to world and regional levels, while table IV presents the data by country.

Reflecting the trend in military expenditures, the number of people in military uniform throughout the world increased by 11 percent in the 10-year period,

from 23.6 million in 1967 to 26.2 million in 1976. This overall trend masked sharp divergences, however. Total NATO military manpower diminished by 26 percent, from 6.6 million to 4.9 million, while Warsaw Pact manpower increased 15 percent, from 5.2 million to 6 million. Military manpower in developing countries rose even more sharply, from 12.1 million to 15.6 million, an increase of 29 percent.

Still, the number of men and women in uniform is not increasing relative to the world's population, nor as compared to the number of teachers and physicians. Looking at the number of people in different categories per thousand, the data show that during the past decade there has been a worldwide increase of about 20 percent in the relative number of teachers. The relative number of physicians has changed little in the past decade.

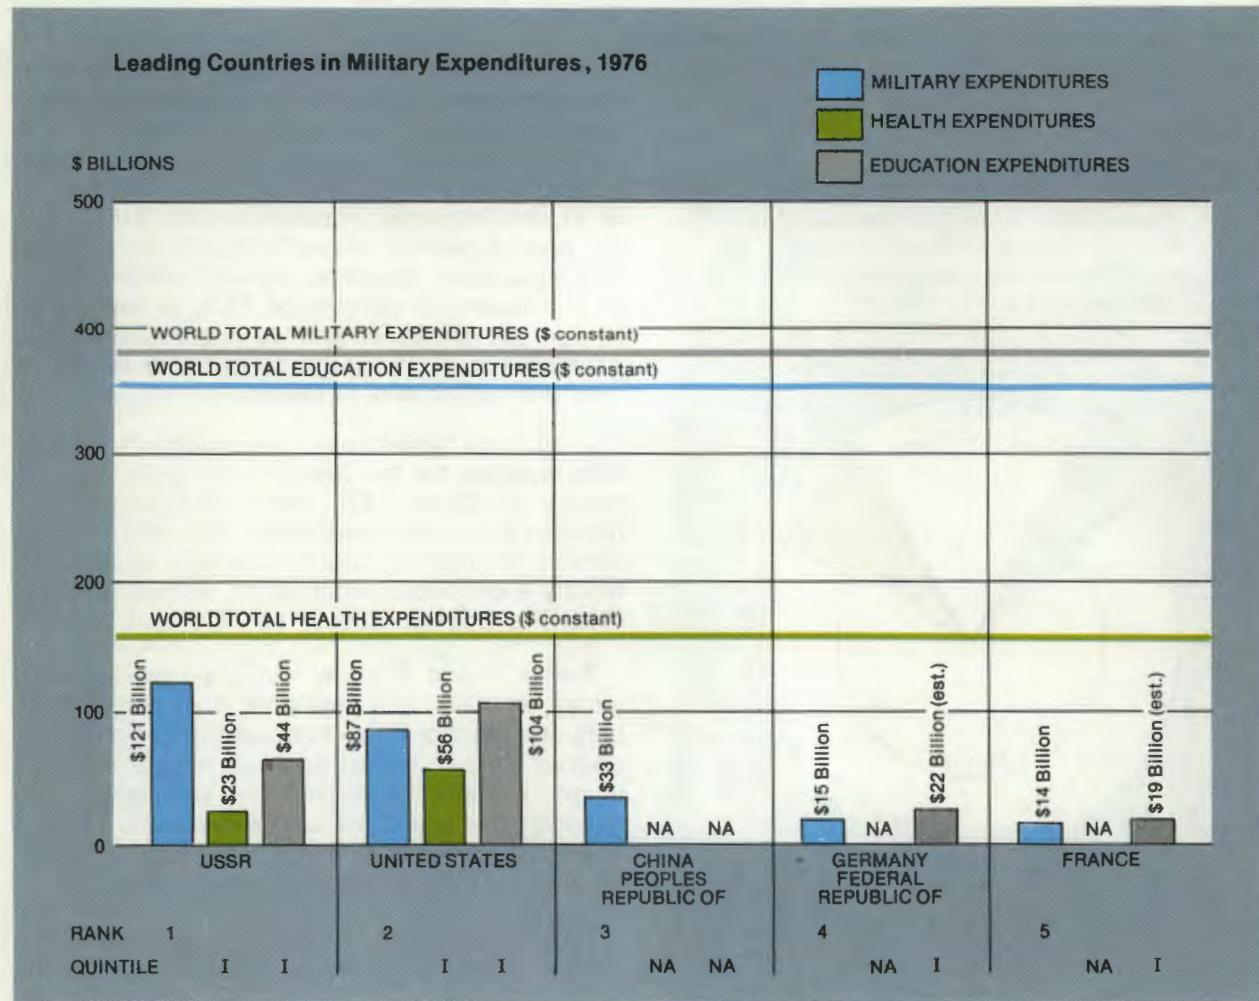

What is perhaps most striking about the data in table III is that, with the exception of nations in East

Asia, the Near East, and the Warsaw Pact, both globally and within each region separately, the relative number of military personnel is not significantly higher than the relative number of teachers. The developed nations as a group have greater proportions of their populations serving as military personnel, teachers, and doctors than do the developing nations.

Data for individual countries show that nations in the Near East had the highest percentages of their populations in the armed forces (figure 10). Two of these states—Israel and Qatar—surprisingly, were also in the top quintile of teachers per thousand population, and Israel was also in the top quintile for physicians per thousand population.⁴

⁴ Data on physicians for three of the five countries were unavailable.

Figure 8

The high values for military expenditures and size of armed forces for the Near Eastern, East Asian, and European nations are not new. However, it is now clear that some countries in Africa and Latin America also have suddenly increased their military spending. The data indicate that 53 countries—about one-third of the nations of the world—spent more, in real terms, for military purposes in 1976 than in any of the preceding 9 years. Almost one-half of these countries are in Africa (16) or Latin America (9). The pattern is even more pronounced with respect to size of armed forces. Of the 42 countries with armed forces larger in 1976 than in any of the preceding 9 years, 17 were in Africa and 9 in Latin America. Conversely, only 4 or 5 countries in the Near East or East Asia reached new highs for either of these variables.

Reflecting greater expenditures for military purposes by less developed nations, the world's trade in conventional arms also continued to rise in 1976.

The total was about \$13 billion, roughly 1½ percent of the world's total trade.⁵ The value of arms imports and exports increased about 60 percent between 1967 and 1976, 6½ percent in the last year for which complete data are available. Estimates of the value of conventional arms imports and exports during the past 10 years, in both constant and current dollars, together with total imports and exports, are shown for the major geographical and political groupings of countries in table V, and are further detailed by individual country in table VI.

⁵ As used here, the term "arms" includes weapons and ammunition, support equipment, and spare parts; but excludes training, services, consumables, and construction. The excluded quantity is not insignificant. For example, for the United States, during the period FY 1960-75, about 41 percent of total military exports were weapons and ammunition, 18 percent supporting equipment, 17 percent spare parts, and 24 percent training, services, and construction. Unfortunately, data on these excluded quantities are difficult to estimate for other nations.

Figure 9

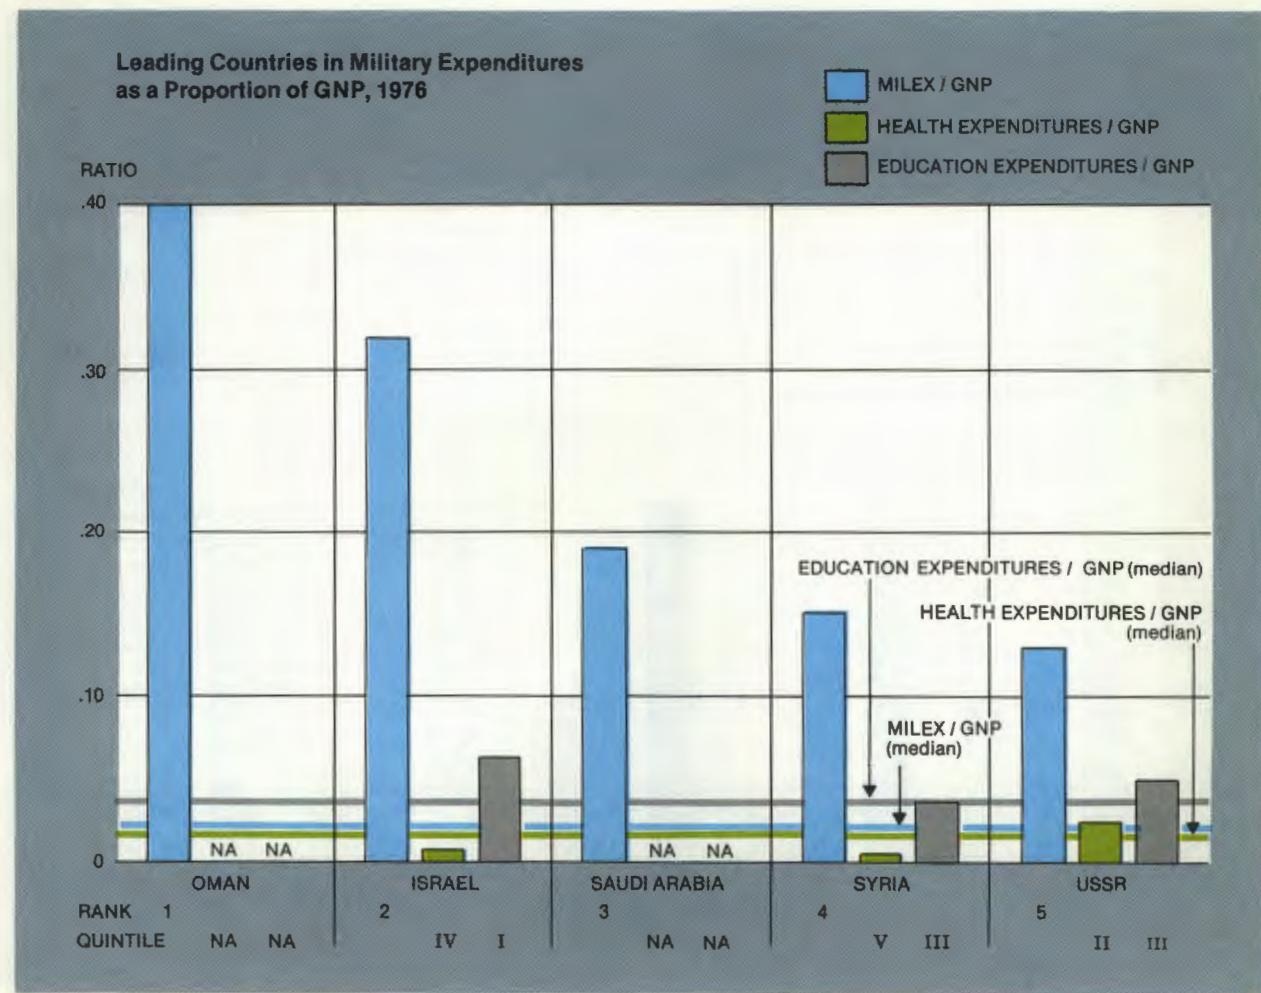

Table VII shows estimates of the dollar value of arms imported by individual countries from each of the major suppliers over the entire 10-year period.

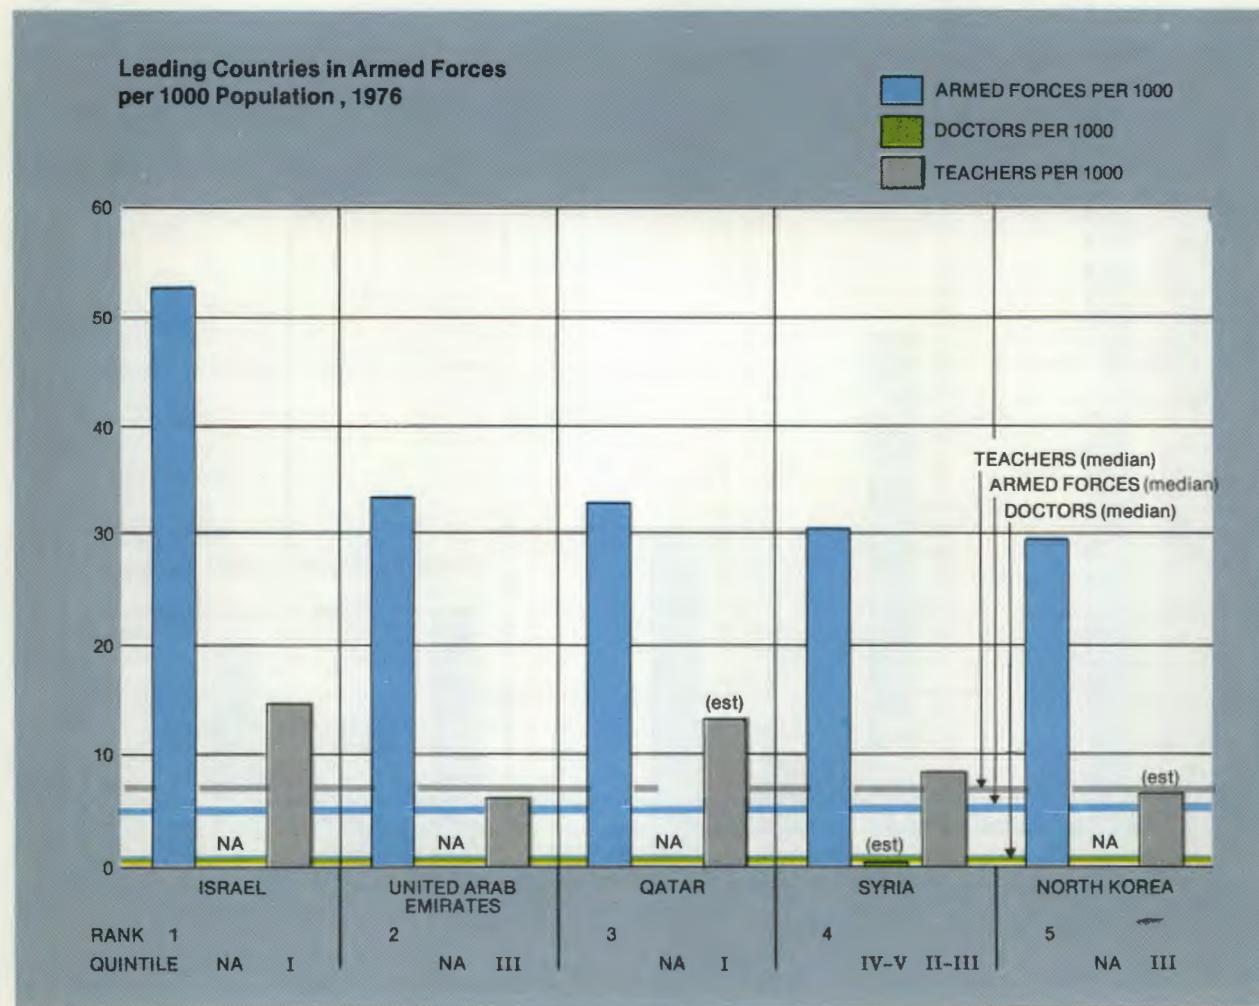

In general, the value of the conventional arms trade increased in all regions throughout the 10-year period, even after adjustment for inflation. This increase reflects both the greater numbers of weapons being transferred and the greater technological sophistication of many of these weapons. Although developed nations received a substantial proportion of the arms produced in the world, nearly three-fourths went to the developing nations (figure 11). The Near Eastern nations were again the leading arms importers in 1976, as shown in figure 12, surpassing both NATO and the Warsaw Pact.

NATO countries continued to import about one-fourth the value of arms that they exported (figure 13). Warsaw Pact countries, for their part, increased their arms exports much more substantially than

their imports. The United States, U.S.S.R., France, the Federal Republic of Germany, and the United Kingdom provided about four-fifths of the world's arms exports (figure 14). Except for the Soviet Union, the top arms exporters are also the leading exporters of all goods (figure 15); these major industrialized nations accounted for more than 40 percent of total world trade.

The developing nations are no longer an insignificant source of arms in world trade, and their contribution is growing. Of the 24 countries that exported more arms in 1976 than in any of the preceding 9 years, even after adjustment for inflation, more than half are classified as developing. Two each are in Latin America (Brazil and Cuba) and the Near East (Israel and the PDRY); four are in Africa (Morocco, Nigeria, Somalia, and Uganda); and five are in East Asia (North Korea, Republic of Korea, Singapore, Taiwan, and Vietnam). The re-

Figure 10

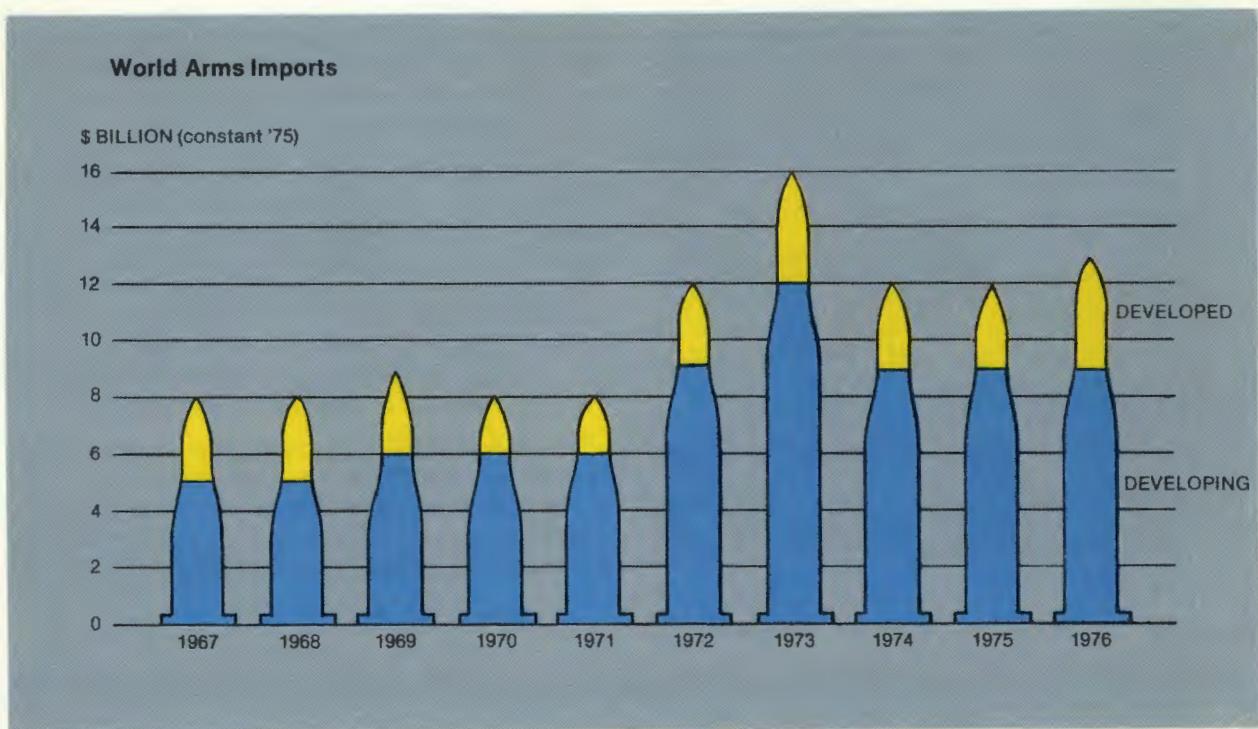

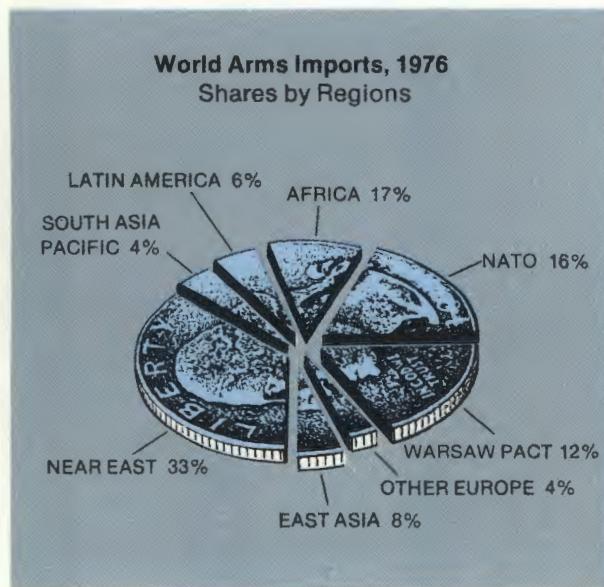

Figure 11

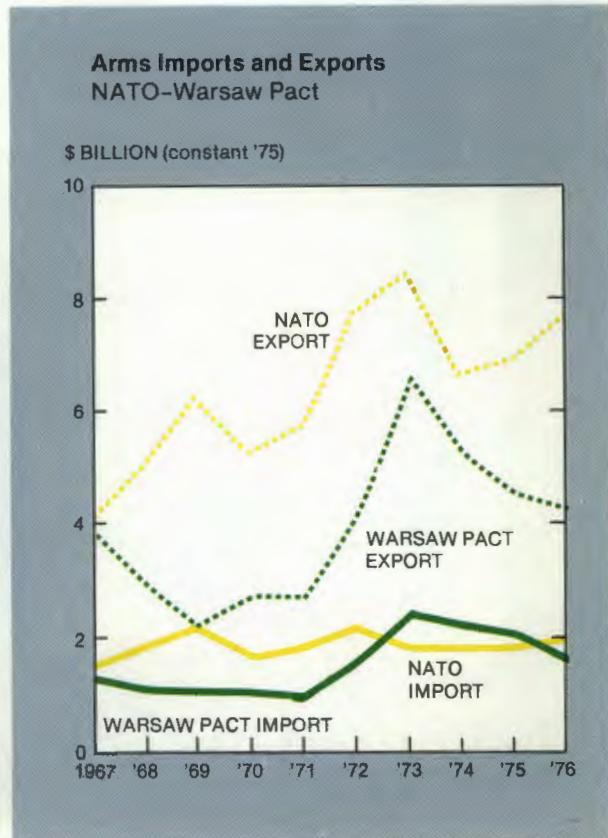

Figure 12

maining three are European (Greece, Spain, and Yugoslavia).

The top four arms importers were all in the Middle East (figure 16); the fifth was the Federal Republic of Germany, a NATO country. The F.R.G. and Iran are both major importers of all types of goods. The

Figure 13

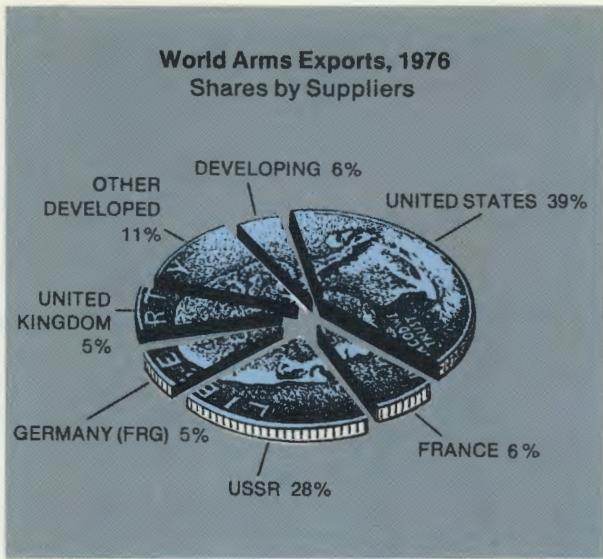

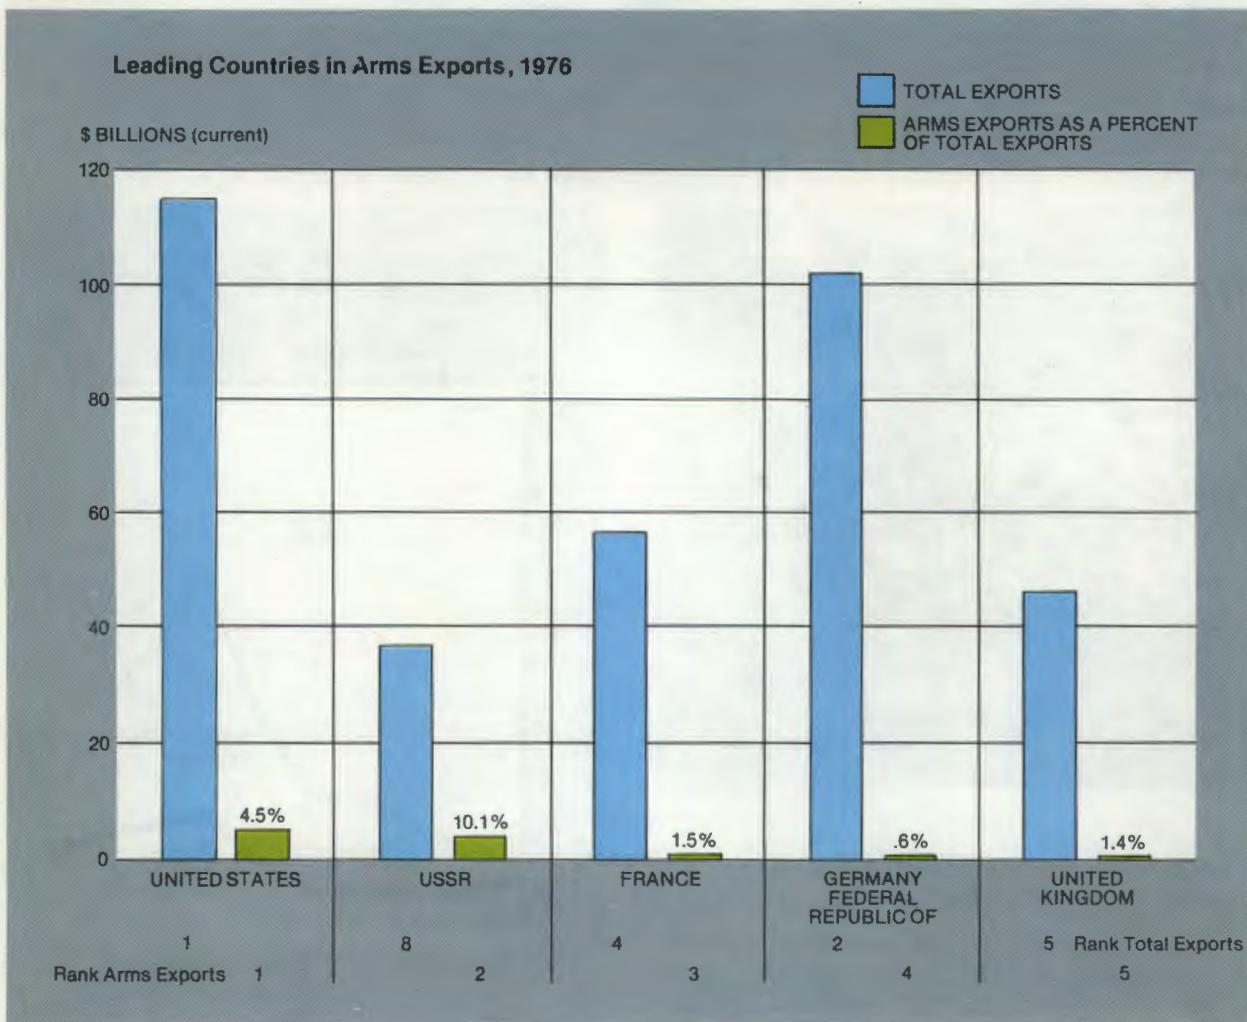

Figure 14

Figure 15

other three (Israel, Iraq, and Libya) are on the borderline between the second and third quintiles in total imports, indicating that arms represent a relatively high proportion of their external purchases in comparison with most countries.

Overall, arms transfers to the Near East returned to their rising trend of earlier years, while those to East Asia continued their decline and were surpassed by the rapid rise in transfers to Africa (figure 17). Arms transfers to the remainder of the world increased significantly but remained behind the leaders (figure 18). The data in figure 19 summarize the changes in arms imports between 1967 and 1976 by these various regions of the world.

The data in tables VIII and IX give some indication of the content of the world's arms trade. They show exports by major suppliers to developing regions of major categories of weaponry—land armaments, naval vessels, aircraft, and missiles—for the 10-year

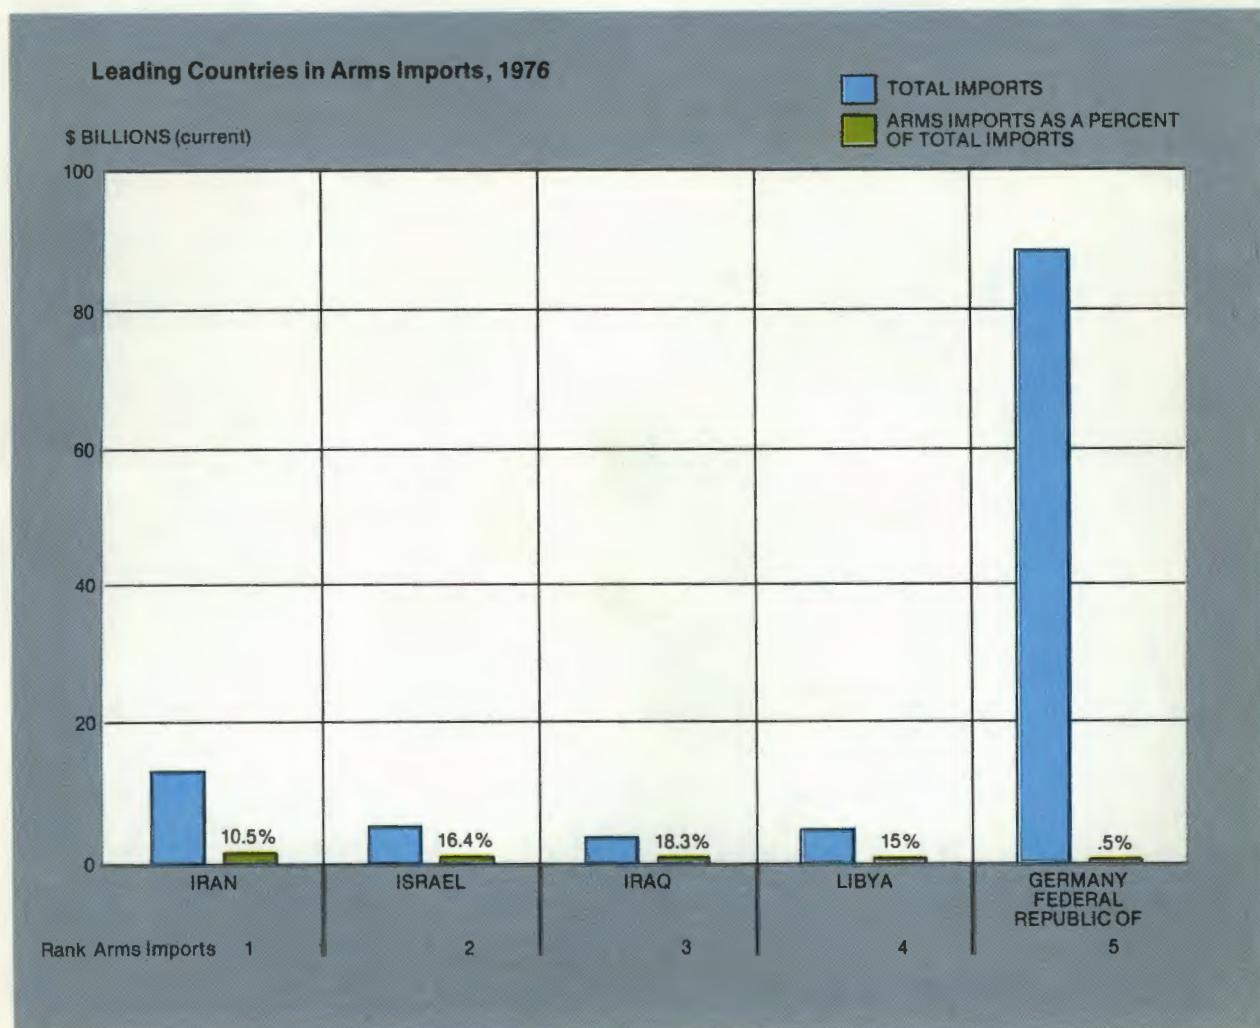

period, 1967-76. These data are drawn from the same variety of sources used in the dollar value accumulations, but are not as complete in scope. For example, data are presented primarily for developing countries, and only for Japan, Australia, New Zealand, and South Africa among the developed nations. Consequently, direct comparisons between the dollar values shown in tables V, VI, and VII, and the equipment data in tables VIII and IX, are not appropriate. Moreover, since the numbers in table IX pertain to hardware items only, and do not include training, services, or support, which amount to an average of about 60 percent of total sales for the United States but a much lower percentage for most other supplier countries, intercountry comparisons also are not meaningful.

The selected military and social data presented here are intended to illustrate the trends in total military expenditures and the arms trade, and thus

to provide a partial framework for assessing some of their implications. The inclusion of social indicators in this edition is not intended to suggest an automatic link or even a vague relationship between distinctly different phenomena. It is hoped, nevertheless, that presentation of social indicators along with military indicators affords some insight into global spending priorities, and in so doing, amplifies the perspective of the reader in assessing the scope and nature of global military activities.

Since this is the first time in several years that this publication has included these social indicators, the Arms Control and Disarmament Agency is interested in the reaction of readers. We will continue our efforts to improve the general availability, quality, and uniformity of both military and socio-economic data, in the hope of promoting the study and solution of global and regional arms control and disarmament problems.

MILITARY EXPENDITURE REPORTING AND LIMITATIONS

Introduction

Proposals to limit military expenditures have a long but unsuccessful history, dating back to the Hague Peace Conference of 1899. In subsequent years, limitations have been suggested by many countries in both bilateral and multilateral forums. In the 1950's and 1960's, the United Nations considered military expenditure issues in a variety of contexts, usually as part of broader arms control and disarmament proposals or studies of the relations between military expenditures and economic development. Questions of military expenditure reporting and limitation have been addressed by a series of United Nations Experts Groups in 1974, 1976, and 1977. These Experts Groups examined the problems of the definition, measurement, and comparison of military expenditures by different countries with different methods of budgeting and accounting. They also developed a standardized instrument for national reporting of military expenditures. Interest in military expenditure reporting and limitation has been heightened by developing countries' concern with what they view as an inadequate flow of aid as a result of excessive levels of military expenditures on the part of the major military powers. Studies and proposals of the relations between disarmament and development have figured in the various discussions of a "New Economic Order," one of the central elements of discussion in the U.N. Special Session on Disarmament.

The Expenditure Approach to Arms Control

In recent years arms control has been concerned almost entirely with the negotiation of quantitative and qualitative limitations on weapon systems, or the prohibition or limitation of certain types of activities. The strategic arms limitation talks and nuclear test ban negotiations are cases in point. Though agreements of this type have variously prevented, retarded, or redirected particular military programs and led to national decisions to limit the size or alter the composition of armed forces, they have been unsuccessful in appreciably limiting the military expenditures of the parties to such arms control agreements. Moreover, restraints on one type of defense program may result in increased efforts in others. In contrast, limitations on military expenditures offer the potential, at least, for across-the-board reductions in military spending. Thus,

because saving finite global resources for purposes other than armaments is clearly desirable, the possibility of negotiated expenditure limitations deserves exploration.

In principle, expenditure limitations could be applied to the entire spectrum of military activity, including those facets difficult to quantify in physical terms and not readily observable, such as research and development. This approach to limitations also could permit each nation to have the flexibility to cope with widely divergent security requirements. Thus maritime countries would be able to emphasize naval forces while other countries might concentrate on land and/or air forces. Alternatively, one could postulate expenditure limitations for particular military programs or combinations of physical and expenditure limitation. Such an approach could, for example, limit general purpose forces by both expenditures and manpower or by expenditures and weapon types. This approach might prove useful in restraining qualitative competition in arms. Even without agreed limitation, military expenditure reporting could promote international confidence if countries could be assured that the military expenditures of potential adversaries were less than suspected. This might have important regional and global applications.

Origins of Current U.N. Studies

The recent history of military expenditure reporting and limitation began at the 1973 U.N. General Assembly with a Soviet proposal for a military budget reduction linked to development aid. Foreign Minister Gromyko proposed that the five permanent members of the Security Council and other states with "major economic and military potential" reduce their military budgets in the following year by 10 percent from the 1973 level and devote 10 percent of this savings to assist developing countries. The United States and other Western countries greeted the Soviet proposal with skepticism; the People's Republic of China strongly denounced it. The United States believes that the Soviet proposal, which made no provision for definition or verification, is inherently unenforceable, in part because the Soviet Union announces only a single total figure as its military budget. This figure does not indicate what elements of Soviet defense programs are covered and what elements are not. In recent years the announced military budget of the Soviet Union has been in the 17-billion-ruble range (about \$23 billion at the official Soviet rate of exchange). Western estimates of total Soviet defense expenditures are much higher. The U.S. Government estimates Soviet military expenditure in 1976 at \$127 billion. (See p. 62.)

Nevertheless, the Soviet proposal inspired efforts in the United Nations to undertake a more detailed study of the technical problems of military expenditure limitation. Later in the session of the 1973 General Assembly, Mexico suggested a study of these problems by experts under U.N. auspices. Finally, the 1973 session of the General Assembly passed both the Soviet resolution and the Mexican proposal for technical study.

The U.N. Experts Group began its meetings in 1974 with representation from a diverse group of nations including the United States, the Soviet Union, and several developing countries.⁶ These experts prepared a report⁷ which examined in considerable detail the definition, measurement, and valuation of the military sector, the effect of potential limitations on international security, and began to address the problem of verification of expenditure limitation agreements. The discussion of definition tries to answer, in both a theoretical and practical way, which activities are military and which are civil. There are obvious ambiguities in "grey areas," such as coast guard units, border forces, military "civic action" units, and similar activities. The problems of measurement and valuation, and their comparison across countries and time periods, involve a number of additional questions. How does one compare expenditures expressed in dollars and rubles? How does one account for inflation? The mechanisms for these comparisons used in the statistical portion of this publication, for example, are fairly simple ones; an international system of military expenditure reporting or potential military expenditure limitation agreements might well require more complex techniques. The 1974 Experts Group report addresses these problems in considerable detail and recommends techniques or solutions for most of them.

The probable effects of military expenditure limitations are not necessarily all benign. Expenditure limitations could induce changes in the force structures of the participants—either a reallocation of resources among forces in being or a reallocation between current and planned strength. Such changes might or might not enhance security. For example, expenditure limitations could lead to greater pressures for countries to invest relatively

more resources in the most destructive classes of weapons as surrogates for larger numbers of less destructive weapons.

Adequate verification is essential to the arms control process and information is the key to the problem of verification. The kind of information required for the necessary verification of any future military expenditure limitations is economic and financial rather than physical; as such, it is fundamentally different from the verification techniques used in arms control agreements to date. New mechanisms would be required—ones that could require disclosure of information some states do not now reveal.

The 1974 U.N. Experts report was generally well received. The United States sought to further the beginning made by the U.N. experts by proposing additional study—this time in the context of the Conference of the Committee on Disarmament (CCD)—of some of the key technical issues mentioned above. Though this proposal never came to a vote, the basic ideas were included in a resolution offered by Sweden and Mexico and adopted by the Fall 1975 General Assembly. The 1976 Experts Group—again with Western participation but now without representatives of the Soviet Union or its allies—sought to advance the work of the 1974 report and, in particular, to lay the groundwork for a system of national reporting of military expenditures in a detailed and standardized format.⁸ To this end, the experts devised a reporting instrument, in matrix form, to serve as a model. It called for expenditures to be broken down both by mission (e.g., naval, air, or ground forces) and by resource type (e.g., personnel, procurement). Such a system facilitates a degree of cross-checking by summing the totals of each of the separate elements—the rows and columns of the matrix. This is the precursor of a verifiable regime of expenditure reporting. The 1976 Experts Group identified a field trial of the reporting instrument, in which a diverse group of nations would actually compile their national military expenditures in the prescribed format, as a useful next step.

The 1976 General Assembly directed that the Secretary General solicit the views of member nations on the reporting instrument and related matters, and created a new Experts Group to consider the responses. These responses were generally favorable; several countries suggested refinements of the reporting instrument and Sweden

⁶ For a complete discussion of military expenditure limitation see Abraham S. Becker, *Military Expenditure Limitation for Arms Control: Problems and Prospects* (Cambridge, Mass. Ballinger, 1977). Dr. Becker was the U.S. expert at the 1974 and 1976 Experts Groups.

⁷ *Reduction of the Military Budgets of States Permanent Members of the Security Council by 10 percent and Utilization of Part of the Funds Thus Saved to Provide Assistance to Developing Countries*, Report of the Secretary General; U.N. Document A/97770/Rev. 1, 1975.

⁸ *Reduction of Military Budgets: Measurement and International Reporting of Military Expenditures*, Report of the Secretary General, U.N. Document A/31/222, 1976.

filled out the reporting instrument with its national military expenditure data. The 1977 Experts Group compiled these responses, made several modifications to the reporting instrument while reaffirming its essential validity, and renewed the recommendation for a field trial by a small but diverse group of states.⁹ The 1977 General Assembly adopted a resolution offered by Mexico and Sweden, incorporating an amendment sponsored by the United States and others, calling for the U.N. Secretary General to compile the recommendations of the three Experts Groups' reports, to determine which nations would be willing to participate in a field trial of the reporting instrument, and to report the results to the Special Session on Disarmament in the spring of 1978.

Conclusions

What are the prospects for military expenditure limitation? The U.N. work of the last 4 years has greatly improved our understanding of the basic issues of expenditure limitation, its possibilities and difficulties. That work has attracted interest and support among Western and some nonaligned countries. A field trial of the reporting instrument by several diverse nations for a single year would be

an important next step. It might then prove possible to move toward a fuller system of voluntary annual reporting of national military expenditures under U.N. auspices. This, in turn, could build confidence in the feasibility of an expenditure approach to arms limitation on a multilateral, regional, or bilateral basis.

The United States recognizes that such agreements will not be easy and are not a near-term prospect. In spite of their useful accomplishments, the future of the U.N. efforts of the past 5 years is uncertain. Some of the developing countries which have supported the effort to date are becoming impatient with the slow pace of the technical work. Many countries are as yet unwilling to disclose details of their military expenditures. Yet the objective is worthy of pursuit. Negotiated expenditure limitations hold the promise of producing disarmament savings with benefits for human needs and economic development in which all countries could share, with no real risk to the security of any country.

⁹ *Reduction of Military Budgets*, Report of the Secretary General, U.N. Document A/32/194, 1977.

SELECTION OF COMPARATIVE INDICATORS

Since its inception in 1966, all issues of this publication have included various economic indicators along with the basic military data. The latter initially consisted of *military expenditures* (milex); *armed forces* data were added in the second issue and various *arms transfer* data in the seventh. The initial indicators providing a comparative background were *population*, *gross national product*, *foreign economic aid*, *public education*, and *public health expenditures*. The latter three variables were omitted from the last three issues.

Beginning with the present (10th) issue, renewed attention is given to the broad question of which types of economic and other data provide necessary comparative background to understand the significance of the military series. This edition contains several new types of data; these include *central government expenditures*, *total exports* and *imports*, and the number of *teachers* and *physicians*. Data series on economic aid, public education, and public health expenditures also have been resumed.

There will be a continuing review of which socio-economic data to present and additional changes may occur in future editions. This article outlines some views on the general question of socio-economic indicators and discusses the changes in this issue. Comments from interested readers will be welcome.

Purpose of Indicators

The choice of appropriate indicators naturally depends in large part on their purposes. As already noted, one purpose is to provide general background information on each country, against which levels and trends in the military data acquire some perspective.

A second purpose for comparative indicators is to provide a concise statistical description of countries in various socio-economic dimensions to give greater meaning to intercountry comparisons. Alternative groupings help to overcome the problem of relying on such broad categories as "developing" and "developed," which encompass differences far too wide to allow basic analysis of the many relationships between military and other factors.

Third, presenting selected socio-economic indicators for as many countries as possible can contribute to the development of better analytic measures of the socio-economic impact of military programs. It should be recognized, of course, that no single or even several measures combined can adequately reflect the total effects of military programs on socio-economic processes, since these impacts are com-

plex, difficult to quantify, and likely to differ with the unique conditions of each country. In many cases, other influences on general economic performance, such as the extent and nature of savings, investment, foreign aid, technological change, national development programs and planning, etc., may overshadow the impact of military factors.

A fourth purpose concerns possible arms control arrangements using an overall measure of military effort—for example, total military expenditures—as the object of limitations. Interest in such military expenditure limitations is evidenced by various proposals for reducing military budgets that surfaced in preparation for the Special Session on Disarmament of the United Nations General Assembly in May-June 1978.¹⁰

There are a number of problems associated with military expenditure as an item to be controlled or limited by agreement, particularly when conceived of as a measure of military product or output. It may have more utility as a measure of resources devoted to military activities, or input. In either case, however, given the disparate sizes and conditions prevailing among various pairs or groups of countries that may be interested in such limitations, it may not be appropriate to control expenditure in terms of equal absolute levels for each country, as measured in a common currency, for example. Is there some relative basis, then, on which military expenditure levels may be compared equitably among countries? Perhaps military expenditures as a ratio to GNP, population, or some other normalizing measure is a more appropriate object to be controlled. Insights into such questions may be gained by presenting and examining a greater variety of socio-economic indicators for all countries.

In addition to purpose, another basis for selecting comparative data is their availability in terms of both coverage and quality. There is, of course, an interrelationship between purpose and availability—different coverage and quality standards apply to some purpose and not to others. If the purpose is only to suggest, give illustrative examples, or to raise questions, less rigorous data standards are needed than if the purpose is to provide an important criterion determining security or development-related policies.

The availability of worldwide statistics is improving. Thus judgments based on the data available a few years ago may no longer hold. In many developed countries a large variety of business, economic, financial, demographic, and other indicators have become available and are routinely used to

¹⁰ See the essay on "Military Expenditure Reporting and Limitations," in this issue.

formulate policies. Improvements in international statistics have been far from universal, but they are occurring gradually, particularly in economic and financial data.

Depending on the purpose, data can be presented in different ways. These vary principally in the grouping of the countries, and the time span chosen.

<i>Country or Group</i>	<i>Time</i>
—All countries, individually	—Each year
—Regions and World	—Selected interval of years (e.g., 3, 5, 10 years, beginning and end of period)
—Alliances and pacts	
—Economic grouping by:	
—size	—Single best year
—wealth	—Average of several years
—development, etc.	—Illustrative year(s), as available
—Illustrative countries, as available	

The problem of missing data is troublesome but not overwhelming. Moreover, it is probably inevitable, at least in the near future, with the number of countries continuing to increase and many just beginning to develop their socio-economic statistical systems. For some purposes, data of less completeness or detail can still be instructive. In many cases, regional or world totals of sufficient reliability can be obtained by using roughly estimated data for missing countries if they are few in number or small relative to group totals.

Measures of Overall Country Size and Performance

To put a country's military program into a perspective that facilitates intercountry comparisons,¹¹ other national measures are useful. Total population is an obvious choice; it is widely used, these data are fairly readily available, and further uses for per capita indicators are important. One physical indicator that appears to correlate closely with military expenditures, at least for wealthier countries, is total productive land area. There are three measures commonly used to assess economic burden: gross national product (GNP), gross domestic product (GDP), and central government expenditure (CGE). GNP, the aggregate value of all goods and services produced in a country, is the most widely used.

¹¹ Problems of making intercountry comparisons of military indicators themselves are not the concern of this essay. On the questions of standardizing the measurement of military expenditures, see "Military Expenditure Reporting and Limitations." Problems of intercountry currency conversion (or exchange rates) and intracountry price changes may be subjects of essays in future editions.

There are a number of problems with the use of GNP or GDP. Overall economic activity (or its product) is commonly viewed as an indicator that should grow constantly and fairly rapidly, beyond the pace needed to keep up with population growth. Consequently, using such a moving background tends to underestimate the growth of military expenditure over time when expressed as a ratio to GNP. There is no apparent objective reason why maintaining national and international security should require greater military activity and expenditure as economies grow in size. It can be hypothesized, of course, that countries tend to spend on arms as much as they can "afford," thus causing the historical growth in arms to be closely correlated with growth in GNP. But if so, it is precisely this tendency that calls for greater arms control and disarmament efforts. After all, the historical growth of the world's global product from 1965 to 1976 was about 4 percent annually in "real" terms (that is, corrected for inflation). Continuing this rate until the year 2000 and maintaining the present world average ratio of military expenditures to total product of 6 percent would mean total world military expenditures of over \$1 trillion constant 1976 dollars by the year 2000. This is equivalent to 60 percent of total U.S. GNP in 1976.

The virtue of GNP as the most comprehensive measure of a country's economic activity can also be a flaw—in a sense, GNP is too large and all encompassing. For most countries the share of milex in GNP is under 10 percent; (the median ratio for all countries in 1976 was 2½ percent; only in 14 countries did it reach two digits). This means that in order to distinguish moderate changes, data in tenths or hundredths of a percent are needed. Furthermore, since GNP encompasses all products and their uses, a very large proportion of GNP ordinarily is not available for military purposes and a substantial portion is never so used. This is because a large part of GNP must be reserved for such civilian purposes as replacing the capital stock that is continually being used up and providing subsistence to the population. Even in wartime, the share of GNP devoted to the military in the United States has never exceeded 45 percent, although it has gone considerably higher in other countries.

Another alternative to GNP comparisons with military expenditures is to use only two components of GNP: gross capital formation plus government consumption. This would represent those disposable resources which a country can shield from immediate consumption by individuals for their personal needs, and which can be applied instead to the preservation, administration, and development of the country. Since statistics on the major components of GNP or GDP are made available for many

countries by such sources as the World Bank, this might be a practical possibility.

A second measure is the gross domestic product (GDP), which is favored by international statistical organizations. GNP measures the income or product of all *nationals* of a country, irrespective of the territory on which it is produced, whereas GDP measures the product produced on a given country's *territory*, irrespective of the nationality of the producer. Since military expenditures are subject to national decisionmaking, a measure of the total resources at the disposal of a country's policy seems clearly preferable. The difference between the two measures is usually small; the ratio of GNP to GDP for most countries is usually within ± 5 percent of unity and is under +1 percent for the United States. However, in a few recent cases GNP has been as much as 36 percent above and as low as 27 percent below GDP.

In this issue, a new comparative indicator has been added—central government expenditures (CGE), or the equivalent of Federal budget expenditure in the United States. CGE provides a measure of resources mobilized on a national scale for centralized public activities, and thus is an appropriate comparative to milex. Countries vary widely in the extent that the total product enters into government finance. Also, countries vary in the degree of governmental centralization—some rely more than others on state and local governments for certain expenditures. An analysis of variability shows that CGE as a percent of GNP averaged 30.6 percent for 126 countries in 1976, and ranged from a low of 2 percent to a high of 85 percent. This indicator as a denominator to milex can thus portray a sharply differing picture of comparative spending levels than GNP, with interesting implications for the burden on centralized government resources. An alternative indicator that eliminates the second kind of variability noted above and that should be somewhat more uniform among countries in the ratio to GNP is total public (or government) expenditures (including state and local as well as centralized). However, this indicator would include essential public service expenditures (e.g., teachers, utilities operation, road maintenance) that could not, in the main, be suspended in favor of centralized military purposes.

In addition to annual indicators of the aggregate product or expenditure type, more permanent economic characteristics of countries may deserve consideration, such as measures of national wealth. However, worldwide availability of such measures is very low.

Comparison of Military and Civilian Activities

The above comparative indicators are essentially aggregates within which military expenditures may be found. Another type of comparison is to show the size of alternative public activities or expenditures. In this issue, we have resumed the use of public education and public health expenditures for this purpose. In addition to problems of data availability, some critics of this comparison have argued that countries vary a great deal in their relative mix of public and private expenditure for these purposes. The scanty data available on worldwide private expenditure suggests, however, that the variance may not be that large; even socialist countries have significant private expenditures of this type.¹²

In addition to expenditures on these alternative uses of resources, this issue contains data intended to give some summary indication of progress over time in these fields; namely, the number of teachers and the number of doctors. These indicators, as a ratio to population, are also compared with the number of persons in the armed forces. Such comparisons supplement the information on expenditures per capita or per person in the armed forces.

In this issue we have employed only indicators of resources used in social services. While the product of health and education activities can be said to be measured by, for instance, infant mortality or life expectancy for the former and literacy for the latter, there are no comparably satisfactory measures of military effectiveness or product.

Comparatives for Arms Transfer

Arms transfer data are compared with another new set of indicators in this issue: total exports and total imports. These give some perspective to arms exports and imports respectively, but alternatives are possible and may indeed be used in future years. For example, it may be more meaningful to compare a country's arms exports with its export of manufactured goods rather than with its total exports. The relative importance to a country of its total trade should also be taken into account in assessing the ratio of arms transfers to total trade. Other useful comparatives for arms transfer purposes might be some measures of a country's hard-currency trade or foreign exchange position.

As noted elsewhere in this report, in making such comparisons the distinction between the *value* of arms actually transferred, as presented here, and the *payments* for these arms transfers, should be

¹² See ACDA, *World Military Expenditures*, 1971, table II, footnotes 3 and 4.

kept in mind. The latter may be delayed to other years or not paid at all and may be in amounts that are greater or smaller than the nominal value of the transfers.¹³

The compilation and presentation of statistical data on world military expenditures is inevitably fragmentary, and interpretation of their significance when viewed against a background of economic

and social data involves subjective judgments. The main thrust of this essay has been to highlight a few of the purposes, problems, and implications involved in selecting basic economic or social indicators for comparative purposes and to begin a process of public discussion of these ideas. The Arms Control and Disarmament Agency believes it is important that increased attention be given to the proportion of total resources devoted to military purposes and to the resultant cost in lost opportunities for serving human needs. We invite comments and suggestions from our readers.

¹³ See Statistical Notes for a discussion of the valuing and estimation of arms transfers.

STATISTICAL NOTES AND SOURCES

For the statistical tables presented above, this section defines the basic terms used, cites the sources of the data, and explains the treatment of some of the major problems of statistical comparability encountered in making a worldwide compilation of this sort. Not all the manifold problems are discussed nor is the treatment here necessarily satisfactory for all applications of the results, even though it may be the best available. Analytic use of the data in the tables, therefore, should be made with caution and in consideration of the discussion below of particular kinds of data and their sources.

COVERAGE AND GROUPING OF COUNTRIES

This report lists data for 145 countries.

Of the present U.N. membership the following are *not* included: the Bahamas, Bhutan, Comoros, Djibouti, Grenada, Maldives, Seychelles, and Western Samoa. Also excluded are nonmembers Andorra, Liechtenstein, Monaco, Nauru, San Marino, Tonga, and Vatican City. Data on military expenditures, forces, and trade are generally unavailable for these nations but are not considered statistically important.

Those countries covered include six that are not members of the United Nations: the Republic of China, the two Koreas, Switzerland, Southern Rhodesia, and Vietnam. (Data are provided on two Vietnams in earlier years for comparability.)

Of the reported countries, 16 became independent since 1967. Data for them are normally shown in the tables beginning with the first year in which they were independent for more than 6 months. However, imputations have been made for earlier years, where appropriate, in calculating regional totals.

The regional country groupings shown are geographical except as follows: "North America" consists only of the United States and Canada; Mexico is included with Central and South America as "Latin America." Also, Egypt is assigned to the "Near East" rather than to "Africa." "Oceania" includes only Australia, New Zealand, Papua New Guinea, and Fiji.

For the political groupings, NATO (North Atlantic Treaty Organization) consists of Belgium, Canada, Denmark, France, West Germany, Greece, Iceland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Turkey, the United Kingdom, and the United States. The Warsaw Pact consists of Bulgaria, Czechoslovakia, East Germany, Hungary, Poland,

Romania, and the Soviet Union. OPEC (Organization of Petroleum Exporting Countries) is made up of Algeria, Ecuador, Gabon, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, United Arab Emirates, and Venezuela.

The 28 countries classed as "developed" in this publication are all those in NATO except Greece and Turkey; in the Warsaw Pact except Bulgaria; in Oceania except Fiji and Papua New Guinea; and Austria, Finland, Ireland, Japan, South Africa, Sweden, and Switzerland. All other nations are classed as "developing." For non-Communist countries, assignment to one or the other category follows the practice employed by the Development Assistance Committee (DAC) of the Organization for Economic Cooperation and Development (OECD). This assignment is based partly on GNP per capita, but also reflects factors such as national literacy, mortality rates, and levels of industrialization.

Most of the data shown are for calendar years. For some countries, however, data represent expenditures during the fiscal year containing the most months of that calendar year; e.g., a fiscal year of April 1975 to March 1976 would be included as 1975. July-June fiscal years were shown in either the column for the first half or the second half of the fiscal year, depending on the availability of data. GNP figures of those countries for which calendar year data are not available were included in the same manner.

A listing of the countries comprising each region or group can be found in table VII, where developed countries are denoted with an asterisk and OPEC countries with a double asterisk.

SOURCES AND DEFINITIONS

Military Expenditures

NATO country military expenditures were obtained from NATO publications and are based on NATO definitions. In summary: (a) civilian-type expenditures of the defense ministry are excluded but military-type expenditures of other ministries are included; (b) grant military assistance is included in the expenditures of the donor country; and (c) purchases of military equipment for credit are included at the time the debt is incurred, not at the time of repayment. For other non-Communist countries, data are mostly the expenditures of the Ministry of Defense.

The difficulties of estimating military expenditures for Communist and other countries with a restrictive information disclosure policy are well known and have been widely discussed in various publications.

For the Soviet Union, estimates are made independently of the announced Soviet defense budget

data by applying dollar prices to detailed estimates of Soviet forces, weapons programs, and activities.¹⁴ The resulting estimates are intended to show what it would cost in the United States, in constant dollar prices, to develop, procure, man, and operate a military force similar to that of the Soviet Union. Such estimates obviously could have a substantial range of error.

The dollar estimates of military expenditures of Warsaw Pact countries other than the U.S.S.R. are from Thad P. Alton and others.¹⁵ The military expenditures shown here refer, in the main, only to officially announced state budget expenditures on national defense. These figures underestimate total military expenditures to the extent of probable defense outlays by nondefense agencies of the central government, local governments, and economic enterprises. In particular, the dollar estimates were derived by calculating pay and allowances at the current full U.S. average rate for officers and at 75 percent of the average U.S. rate for lower ranks. The part of the official East European budgets for defense that remains after subtraction of armed forces pay and allowances in national currencies was converted into dollars at overall rates based on comparisons of the various countries' GNP's expressed in dollars and in national currencies. These rates are not as specific as one might desire, and when taken into account with the incomplete coverage of the published explicit defense budgets, they result in dollar estimates that must be considered subject to limitations. As in the case of the Soviet Union, these estimates are intended to show what the military programs would cost at U.S. prices. However, a basic inconsistency exists between NATO and Warsaw Pact data in that the nonpersonnel component of military assistance is not covered in the Warsaw Pact estimates.

No budgetary data have been issued by the People's Republic of China since 1960. The estimates used here are derived from the same sources cited for Soviet data.

Gross National Product (GNP)

The reported GNP represents the total output of goods and services produced by residents of a country and valued at market prices ultimately paid by the consumer.

The source of GNP data for non-Communist countries is the International Bank for Reconstruction and Development (IBRD).

GNP estimates for the Soviet Union are from the Central Intelligence Agency, *Research Aid: Handbook of Economic Statistics—1977*, (September 1977), p. 31.¹⁶

The GNP data for other Warsaw Pact countries were taken from the Central Intelligence Agency's *Handbook of Economic Statistics, 1976*, and from Thad P. Alton and others, "Defense Expenditures in Eastern Europe, 1965–1976," *op. cit.*, p. 270.

GNP estimates for the People's Republic of China are from the Central Intelligence Agency's *Handbook of Economic Statistics* cited above. Estimates for other Communist countries are rough approximations.

Military Expenditure-to-GNP Ratio

It should be noted that the meaning of the ratio of military expenditures to GNP shown in tables I and II above differs somewhat between Communist and non-Communist countries. For non-Communist countries, both military expenditures and GNP are converted from local currency units to dollars at the same exchange rate; consequently, the ratio of military expenditures to GNP remains the same in dollars as in terms of local currency. For Communist countries, however, military expenditures and GNP are converted to dollars differently. Soviet military expenditures, for example, are estimated in a way designed to show the cost of the Soviet armed forces in dollars, i.e., as if purchased in this country, whereas the GNP measure has traditionally been designed to show the average relative size of the U.S. and Soviet GNP, when both are expressed in both currencies.¹⁷ However, the results may not

¹⁴ See Hearings before the Subcommittee on Priorities and Economy in Government of the Joint Economic Committee (JEC), Congress of the United States: Part I, "Allocations of Resources in the Soviet Union and China—1975," June 18 and July 21, 1975, pp. 21–36; Part II, "Allocations of Resources in the Soviet Union and China—1976," pp. 17–25, 76–85; Part III, "Allocations of Resources in the Soviet Union and China—1977," pp. 16–27, 36–41, 74–84; and CIA, *A Dollar Cost Comparison of Soviet and U.S. Defense Activities, 1967–1977*, January, 1978.

¹⁵ "Defense Expenditures in Eastern Europe, 1965–1976," in Joint Economic Committee of Congress compendium, *East European Economies Post Helsinki*, August 1977, pp. 281–282.

¹⁶ For a description of the underlying ruble estimates, see Rush V. Greenslade, "The Real Gross National Product of the USSR, 1950–1975," in a Compendium of Papers submitted to the Joint Economic Committee, Congress of the United States, *Soviet Economy In a New Perspective*, October 14, 1976, pp. 269–300.

¹⁷ In more technical terms, the difference is equivalent to converting from local currency to dollars by means of an average ratio of prices in the two countries in which individual price ratios are weighed, in the case of military expenditures, by the relative quantities within the military sector of the non-U.S. country only, while in the case of GNP, by the average of relative quantities in both countries. The result in the latter case is not really dollars, but is a hybrid ratio of the two countries' GNP sizes which is then applied to the U.S. GNP in dollars and is by convention labeled "dollars."

differ significantly in the case of the Soviet Union. It has been estimated that since 1970 the Soviet ratio of military expenditures to GNP, when measured in *rubbles*, is on the order of 11–13 percent (see sources for military expenditures). This range encompasses the ratios in dollars shown in table II. For Eastern European countries, the ratios of military expenditures to GNP are on the order of twice as high in dollar terms as in normal domestic currency terms (see Alton and others, *op. cit.*). However, since official military budgets probably understate full military expenditures substantially, the ratio in dollars is believed to be a better approximation of the desired measure.

The ratios of military expenditures to central government expenditures, which for all countries are converted to dollars by the same implicit rate as GNP, are subject to similar reservations.

Central Government Expenditures

These expenditures include current and capital (developmental) expenditures plus net lending (gross governmental lending minus repayments of past loans), but purchases of equities are excluded. The primary source for these data is the Agency for International Development (AID), so the definition adhered to by that Agency is used for the 139 countries for which data for any years were available.

In addition to AID files, the other sources for these data were the *UN Statistical Yearbook, 1976*; *OECD Economic Surveys*, and individual country yearbooks. Data for Warsaw Pact countries are from national publications as supplied by Thad P. Alton and others. For all Warsaw Pact countries, conversion to dollars is at the implicit rates used for dollar estimates of GNP.

Health Expenditures

The preferred definition for health expenditures is those expended by all levels of government, central or federal, state or provincial, and local. Both current and capital expenditures are included in the World Health Organization (WHO) definition. Of the 127 countries for which data were available, 61 percent are limited to central or federal expenditures only, and 10 percent include only current (not capital) expenditures, as indicated by the footnotes. Adherence to a single broad definition for each country for all years for which data were available was possible for all but 15 percent of the countries. Nevertheless, due to different concepts, classification systems, and coverage on various countries, inter-country comparisons may be misleading.

Adjustments in values for 1 year or more, based on partial data, were made for 23 percent of the

countries, either to accommodate a broader or more restricted definition, or to convert data to an annual basis from a longer or shorter period.

The primary source used was the *World Health Statistics Reports*, Vols. 24–28, for 1971–75 (all no. 11). Data were also obtained from: OECD, *Public Expenditures on Health*, Paris, July 1977; *UN Statistical Yearbook, 1976*; *UN Yearbook of National Account Statistics, 1975*; and data from the files of the Agency for International Development and, for the United States, the Department of Health, Education and Welfare.

Warsaw Pact figures are from national publications as supplied by Thad P. Alton and others, and are converted to dollars at implicit GNP rates.

Education Expenditures

These data usually cover total public expenditures on public education (both current and capital) by all levels of government, central or federal, as well as state or provincial, and local. As the footnotes indicate, however, there are many exceptions. Of the 132 countries for which data were available for any part of the period 1967–76, 46 percent encompass central or federal government expenditures only, 8 percent refer to current expenditures (excluding capital), and 14 percent also include some or all of the public expenditures on private education.

Adjustments in values for 1 year or more, based on partial data, were made for 35 percent of the countries, either to accommodate a broader or more restricted definition, or to convert data to an annual basis from a longer or shorter period.

The primary source of data was a computer printout provided by UNESCO in September, 1977, and *UNESCO Statistical Yearbooks* for 1971, 1973, 1974, and 1975. Other sources were: the *UN Statistical Yearbook, 1976*; *UN Yearbook of National Account Statistics, 1975*; *OECD Educational Statistics Yearbook, Vol. 1*, Paris, 1974; *OECD, Educational Expenditures for France, Japan and the UK*, Paris, 1977; and data from the files of the Agency for International Development and, for the United States, the Department of Health, Education, and Welfare.

Data for Warsaw Pact countries were supplied by Thad P. Alton and others, and are converted to dollars at implicit GNP rates.

Population

Population estimates given are for midyear and are supplied by the International Statistical Program Center, Bureau of the Census, U.S. Department of

Commerce. Data on the People's Republic of China are midyear estimates prepared by the Foreign Demographic Analysis Division, Bureau of Economic Analysis, U.S. Department of Commerce.

Armed Forces

Armed forces refer to active-duty military personnel, including paramilitary forces where those forces resemble regular units in their organization, equipment, training, or mission. Reserve forces are not included unless specifically noted.

Figures for the United States represent midyear totals and are from "Active Duty Military Personnel by Selected Periods," U.S. Department of Defense, Office of the Assistant Secretary of Defense (Comptroller), August 23, 1977. Estimates of the number of men under arms for other countries were provided by U.S. Government sources.

Physicians

Data on physicians represent graduates of a medical school or faculty actually working in the country in any medical field (practice, teaching, administration, research laboratories, etc.). The primary source used was *World Health Statistics*, Volume III, "Health Personnel and Hospital Establishments." Data were compiled by the World Health Organization, Geneva, Switzerland.

Teachers

Data on teachers represent aggregates of national statistics separately compiled for faculty and staffs at elementary, secondary, and college levels and vocational schools. The primary sources used were UNESCO Statistical Yearbooks. In some cases, data from national publications were used.

Arms Transfers

Arms transfers represent the international transfer under grant, credit, or cash sales terms of military equipment usually referred to as "conventional," including weapons of war, parts thereof, ammunition, support equipment, and other commodities considered primarily military in nature. Among the items included are tactical guided missiles and rockets, military aircraft, naval vessels, armored and nonarmored military vehicles, military communications and electronic equipment, artillery, infantry weapons, small arms, ammunition and other ordnance, parachutes, and uniforms. Also included are transfers of equipment for defense industries. Excluded by definition are nuclear, chemical, and biological weapons, and strategic missile systems. Also excluded are foodstuffs, medical equipment,

and other items potentially useful to the military but with alternative civilian uses. Training and technical services are not included. The statistics published here are estimates of the value of goods actually delivered during the reference year, in contrast to the value of programs, agreements, contracts, or orders which may result in a future transfer of goods, or to the actual payments made for such deliveries. Furthermore, the data represent arms transfers to governments and do not include the value of arms obtained by subnational groups.

For U.S. figures, ACDA used official trade statistics on arms transfers compiled by the U.S. Bureau of the Census and information provided by the U.S. Department of Defense.¹⁸ For data on foreign countries, ACDA used official U.S. Government sources. The difficulties in collecting information on the full scope of Soviet deliveries and in placing a value on them require that the Soviet figure be regarded as an approximation.

Close comparisons are not warranted between the values shown for arms transfers and the estimates of GNP and military expenditures. The disparities among national economic systems generate differences in the extent to which weapons prices represent true production costs in different nations. In particular, the relative economic value of arms to supplier and recipient may be considerably different. Furthermore, much of the international arms trade involves barter arrangements, multiyear loans, discounted prices, third-party payments, and partial debt forgiveness. Thus, acquisition by a nation of some given quantity of armaments does not necessarily impose the burden on its economy that is implied by the estimated equivalent U.S. dollar value of the shipment. Therefore, the economic value of arms imports should not be related in detail to the local economies.

Total Imports and Exports

The values for imports and exports cover both goods and services. Those for non-Communist

¹⁸ The data for the Military Assistance Program, Foreign Military Sales, and commercial sales components of U.S. arms exports prior to 1974, which were compiled under contract for ACDA by the U.S. Department of Commerce, may vary from the data compiled by the Departments of State and Defense under those categories for the following reasons: (1) all arms transfer data in this publication are by calendar year, whereas the Departments of State and Defense data are compiled by fiscal year; (2) the ACDA data reflect exports of military equipment only, while the Department of Defense data include the value of training, services, and POL; and (3) the ACDA data include some categories of dual civil-military use equipment, e.g., certain categories of transportation and communications equipment, that are not on the U.S. Munitions Control List and thus are not included in the Departments of State and Defense data.

countries come from the U.N. System of National Accounts as published in *International Financial Statistics* by the International Monetary Fund. The Communist trade figures are from the CIA *Handbook of Economic Statistics*, 1975 and 1976 editions.

Readers should be cautioned that for many countries, perhaps most, arms trade is excluded from nationally reported totals for exports and imports. As a consequence, a comparison of arms imports and "total imports," as shown in table VI, may show the former to be as large or larger than the latter. (For example, see Cambodia, Laos, Luxembourg, North Vietnam, and Syria.)

COMPUTATIONAL PROCEDURES

Prices

Widespread inflation and sharp price swings in primary commodities over the past decade introduce significant distortions into the data when expressed in current prices. The armaments procurable for a million U.S. dollars at the prices prevailing in 1967 cost considerably more dollars at prices prevailing in 1976. Thus, the reporting of annual purchases only in prices prevailing in each year, or current prices, would present an impression of growth in military expenditures and arms transfers which would seriously misrepresent the trend in total outlay for defense goods and services and the physical acquisition of armaments. Yet no simple adjustment for prices is entirely valid. Inflation rates vary among nations; in particular, they often differ between supplier and recipient for a given series of arms transfers. Furthermore, the inflation rate for a nation's economy as a whole is not necessarily representative of those economic sectors particularly involved in the production of armaments. Unfortunately, no general basis exists for separating out the special impact of inflation on the armament-related sectors of different nations' economies.

Nevertheless, inflation is clearly a very significant factor in analyzing the trend of military expenditures, arms transfers, and GNP over the last decade. For this reason, in addition to showing trends in current prices, the trends of military expenditures, arms transfers, and GNP are also shown in constant prices, i.e., expenditures in each year valued at 1975 prices.

Estimates of the values of arms transfers for all countries as shown in tables V and VI were made initially in terms of current U.S. dollars, so the implicit deflator for U.S. GNP data was used to derive arms transfers in constant 1975 prices as follows:

1967 = 63.13	1972 = 79.36
1968 = 65.93	1973 = 83.91
1969 = 69.17	1974 = 92.32
1970 = 72.75	1975 = 100.00
1971 = 76.34	1976 = 104.97

The source data for military expenditures and GNP, however, were obtained in terms of local currencies. Approximate compensation for the effects of inflation was made by "deflating" the current local currency values to constant 1975 local currency values and then converting to U.S. dollar equivalents.

For non-Communist countries, national accounts data were available in local currency in current prices and in constant prices of varying base years. The constant price figures were shifted from the country base year to the 1975 base year with the underlying trend maintained.

GNP price indices (deflators) were then derived for each country and used to deflate military expenditures to constant prices with the following exceptions:

- a) For OPEC countries, use of the GNP deflator created distortions because of the atypical oil price increases, so special deflators were developed for the non-oil sectors of the economy of each country.
- b) Israel has experienced a high rate of inflation in recent years, but its large arms purchases in the United States were subject to less severe inflation. A special deflator was derived by applying the index of prices of U.S. Government purchases of durable goods to Israel's foreign arms purchases and the Israel GNP deflator to domestic arms purchases.

Conversion to Dollars

Since constant price data for GNP and military expenditures are given with 1975 as the base year, a 1975 exchange rate was used to convert the constant price national currency data to dollars in all years. In general the rates used are the 1975 average par/market exchange rate as supplied by IBRD.

An example may help in understanding this process:

1. 1967 Austrian MILEX = 3661 million 1967 schillings (AS)
2. 1967 Austrian GNP deflator ("price index") = 62.5
3. 1975 Austrian deflator = 100.0
4. 1967 Austrian MILEX
= $3661 \times 100.0 \div 62.5$
= 5858 million 1975 AS

5. 1975 Austrian/US exchange rate = 17.42
AS per US\$1

6. 1967 Austrian MILEX
= $5858 \div 17.42$
= 336 million 1975 US dollars

For some purposes, it may be desirable to have estimates of the military expenditures and GNP for each country in terms of current U.S. dollars. That is, in terms of the example, one might wish to know Austrian 1967 military expenditures in terms of 1967 U.S. dollars. At first glance it would seem to be necessary only to apply the appropriate 1967 exchange rate to obtain the desired value. That was in fact the method used in early editions of this publication. Unfortunately, this approach produces distortions in countries where there is a lag between the time the currency becomes over- or under-valued and the time the exchange rate is changed.

A different method for estimating current dollar equivalents of foreign military expenditures and GNP is used here. The constant 1975 dollar values derived as described above have been "re-inflated," using the U.S. GNP deflators in reverse fashion, to generate equivalent current U.S. dollar values for each year. Thus, the successive yearly "current dollar" values include not only the change in real terms, but the effects of general inflation in the United States.

Again using the example of 1967 Austrian military expenditures to illustrate the computational process:

1. 1967 Austrian MILEX = 336 million 1975 US dollars
2. 1975 US deflator = 100.00
3. 1967 US deflator = 63.13
4. 1967 Austrian MILEX
= $336 \times 63.13 \div 100.00$
= 212 million 1967 US dollars

Communist Countries

For the Soviet Union and other Warsaw Pact countries, available estimates were already in terms that took account of domestic price changes and had been converted to constant 1975 dollars by the sources using estimated purchasing power parities, rather than official exchange rates. Such series were further converted to current dollar prices prevailing in the United States for each year by use of the U.S. implicit GNP deflator series.

The previously described problems inherent in comparing arms transfer data with GNP and military expenditure estimates for any countries are particularly significant for transfers between Communist and non-Communist economies, because of the

computational differences employed in the two cases.

Estimates

Most of the data series added this year were incomplete. Not all countries collect national statistics every year, and relatively few have published them for 1976 even if collected. Some of these data series have never been aggregated in the groupings shown here. In calculating regional and world totals, if the missing entries are simply ignored, the resulting aggregates will be deceptively low. Omitting an entry is statistically equivalent to assuming it to be zero, which is clearly false and produces misleading results.

In order to reduce this source of error, estimates of the missing values were made on the basis of the existing data points. Standard "least squares" methods were used to fit the data, and a linear fit was employed except as noted below. In addition to using the resulting estimates to derive aggregates, we have indicated the 1976 estimates in *italics* for the convenience of the reader. No adjustments have been made to reflect special situations or to otherwise bias the information provided the reader. As stated, a simple straight line approximation was normally used, but in some cases a logarithmic approximation provided a much better fit to the data, indicating that the variable in question had experienced a compound growth rate. The logarithmic approximation was adopted if its standard deviation was less than half that of the linear model. Occasionally the existing data showed that the variable was rising early in the decade but then passed through a peak and declined—or, conversely, that it passed through a minimum and then rose. In these cases a second degree equation obviously provided a superior approximation, and was used when its standard deviation was less than half that of either the linear or logarithmic models.

Where only one data point was available, a curve could not be derived. When the variable represented people—i.e., teachers or physicians—the ratio between the given value and the population in the same year was used to estimate the values for the other years. When the variable represented public expenditures—i.e., for education or health—the ratio between the given value and central government expenditures in the same year (or gross national product, if CGE was unavailable) was used to estimate the values for the other years. When two data points were available, a linear or logarithmic approximation could in principle be derived. However, if the two points were adjacent even a small error in either—such as legitimate round-off error—would produce major shifts in the derived approximating curve and, thus, in the estimates of missing

values. Accordingly, in such cases the average of the ratios of the two points to the population or to central government expenditures, as appropriate, was used to estimate the values for the remaining years.

With two exceptions these estimated values were used only for purposes of calculating regional or organizational aggregates, where the law of large numbers minimizes the error involved. It was felt that users of the publication might find it helpful if the estimated values for 1976 were shown in the absence of actual data. Accordingly, these 1976 estimates are shown in *italics*. *It must be empha-*

sized that these estimates are only mechanical derivations from prior year data, and were not adjusted to reflect any special knowledge of the countries themselves.

The estimated 1976 values were also used as a basis for ordering the countries in terms of the several variables for use in the Highlights section. However, because of the acknowledged uncertainty associated with these values, the resulting specific rankings of the countries were ignored and only the pertinent quintile has been cited. Even then, where the estimated ranking of a country of interest shows it to be close to the cut between quintiles, both are shown (as II-III).

- a) For conversion methodology, see Statistical Notes.
- b) For conversion methodology, see Statistical Notes.
- c) Military Expenditures and GNP as calculated are not fully comparable due to the use of different types of dollar conversion rates for the two variables. The estimated range is a more valid measure. (See Statistical Notes.)

- a) For conversion methodology, see Statistical Notes.
- b) For conversion methodology, see Statistical Notes.
- c) Data definitions vary during the period. If this foot-note is followed by another, the definition of most of the data is indicated.
- d) Expenditures or budget allocation of the central or federal government only, or of the Ministry of Education only.
- e) Not limited to central or federal government nor Ministry of Education only.
- f) Special country deflators were used to calculate constant 1975 dollar military expenditures.
- g) Expenditures or budget allocation of the central or federal government only, or of the Ministry of Public Health only.
- h) Current or ordinary expenditures only, excluding capital or extraordinary expenditures.
- i) Including some or all of public expenditures on private education.
- j) Estimated either on the basis of partial data or by adjusting to a more restricted definition.
- k) Data for more or less than 12 months adjusted proportionately to 12 months.
- l) Not limited to central or federal government nor Ministry of Public Health only.
- m) Represents the ratio of military expenditures to GNP, with both expressed in dollar terms. Since the two indicators are converted to dollars or estimated in dollars differently, their ratio in dollars will differ from their ratio in domestic currency terms. See Statistical Notes, "Military Expenditures-to-GNP Ratio."

TABLE II. Military Expenditures, GNP, Central Government Expenditures, Public Health Expenditures, and Public Education Expenditures by Country by Year -Continued

- n) Including some other expenditures or budget allocations. Central African Empire, Ministry of Social Affairs; Dominican Republic and Rwanda, expenditures on social affairs; Saudi Arabia, Red Crescent Society.
- o) Includes general administration and defense expenditures.
- p) Some exclusions. Cyprus, Office of Greek Education only; Ethiopia, France, Lebanon, Philippines, and Syria, universities; Jordan, West Bank and universities; Madagascar and Niger, foreign aid; Poland, sciences; Tanzania, Zanzibar; Venezuela, foreign aid and other sources.
- q) Including some other expenditures or budget allocations. Denmark, Greenland and Faeroe Islands; France, overseas territories.
- r) Some exclusions. Egypt, development budget; Nigeria, three eastern states.
- s) Includes Ministry of Interior expenditures.
- t) Includes police expenditures.
- u) Total for all levels of government, including research and development and administrative costs.
- v) Data not of comparable reliability to other inputs.

Note: Where actual data for 1976 were unavailable, estimated values, shown in italics, have been projected by standard statistical techniques. These are mechanical derivations and do not reflect any special knowledge of the specific country involved. See Statistical Notes for further details.

------	-------------------	-----------------------------	----------------------	------------------------	--	-----------------------------------	-------------------------------------	----------------------------------	------------------------------------	---	---

- a) Coverage of these data unknown.
- b) Personnel in government services.
- c) Preliminary, approximate, or estimated data.
- d) Paramilitary forces are not included.
- e) Number on the register. Not all working in the country.
- f) Hospital personnel.
- g) Paramilitary forces are not included for 1967 and 1968.
- h) 1967-1969 figures reflect Sihanouk era strengths.
1970-1974 figures reflect strengths of Khmer Republic.
1975 figure is that of Cambodian Communist Army.
- i) Incomplete data.
- j) Paramilitary forces are not included. The figures for 1974-1975 do not necessarily represent an increase of PRC military strength. Rather, they represent a declassification of previously classified information.
- k) Militia is included for 1972-1974.
- l) National Security Volunteer Corps is no longer considered a paramilitary force and has been deleted since 1974.
- m) Constabulary force is included for 1971-1974.
- n) 1967-1974 figures reflect strength of Force Armee Royale (FAR). 1975 figure represents the LAO People's Revolutionary Army.
- o) Armed forces of Lebanon disintegrated during period of civil strife, 1976-1977, and have not been reconstituted.
- p) Paramilitary elements of the National Security Force are included for 1968 and 1969.
- q) The 1974 increase is due to anti-unemployment measures and includes trade/vocational training.
- r) Police are included from 1967-1970.

- s) Includes constabulary for 1974-1975.
- t) Portuguese armed forces drastically reduced because of ending African involvement, domestic political adjustments, and economic constraints.
- u) The figures for 1973-1975 include police mobile forces only.
- v) The 1975 figure is that of the People's Army of Vietnam, including the South Vietnamese Liberation Army forces.
- w) The national gendarmerie is included for 1973-1975.
- x) Data not of comparable reliability to other inputs.

Note: Where actual data for 1976 were unavailable, estimated values, shown in italics, have been projected by standard statistical techniques. These are mechanical derivations and do not reflect any special knowledge of the specific country involved. See Statistical Notes for further details.

TABLE VIII. Total Number of Weapons Exported by Major Suppliers^a to Developing Regions^b
from 1967-1976 by Major Equipment Type -Continued

EQUIPMENT TYPE	TOTAL	UNITED STATES ^c	SOVIET UNION	FRANCE	UNITED KINGDOM

^aTotals include the "developing" countries, as previously listed, and the following "developed" countries: Australia, Japan, New Zealand, and South Africa.

^bThe suppliers included are the four largest exporters of major weapons, in terms of the magnitude of deliveries.

^cU.S. data are by fiscal years, 1968-1977, while other suppliers data are by current years, 1967-1976. U.S. total does not include a small amount of commercial deliveries.

^aArtillery includes mobile rocket launchers, mortars, and recoilless rifles over 100mm.

^bMajor surface combatants: aircraft carriers, cruisers, destroyers, destroyer escorts, and frigates.

^cMinor surface combatants: motor torpedo boats, subchasers, and minesweepers.

^dOther aircraft: reconnaissance aircraft, trainers, transports, and utility aircraft.

TABLE IX. Total Number of Weapons Exported by Major Suppliers to Developing Regions*
from 1967-1976 by Region by Major Equipment Type -Continued

EQUIPMENT TYPE	TOTAL	UNITED STATES	SOVIET UNION	FRANCE	UNITED KINGDOM

*Totals include the "developing" countries, as previously listed, and the following "developed" countries: Australia, Japan, New Zealand, and South Africa.

#U.S. data are by fiscal years 1968-1977, while other supplier data are by current years, 1967-1976. U.S. total does not include a small amount of commercial deliveries.

**Totals for the Oceania and Near East region do not include Soviet transfers to Vietnam, nor are transfers to Indochina under the MASF (Military Assistance Service Funded) program included.

^aArtillery includes mobile rocket launchers, mortars, and recoilless rifles over 100mm.

^bMajor surface combatants: aircraft carriers, cruisers, destroyers, destroyer escorts, and frigates.

^cMinor surface combatants: motor torpedo boats, subchasers, and minesweepers.

^dOther aircraft: reconnaissance aircraft, trainers, transports, and utility aircraft.
